DRAFT – Universal anchor

§ . . : Conflict-free multi-track work-division + exactly-once claim registry + capability-aware deadlock-proof device-lock (REM- + REM- + REM-)

1 1 4 2 6

5

Revision: Last modified:

- - T 4 113 : : Z Status: READY-TO-LAND
draft (NOT yet landed). Conductor lands via § . .
(fetch-first → reconcile final number → paste into the
carriers → propagation gate + paired mutation → push all
upstreams ff-only § . .). This file is authored by
Stream A per § . . (safe reversible artifact
instead of a high-blast-radius half-edit of the live
carriers under an active rate-limit). **Classification:**
universal (§ . .) – a project-neutral multi-track
parallel-development safety mechanism reusable by ANY project
running N work-streams over M shared resources; the consuming
project supplies its concrete claim-store, device pool, and
resource-metric sources per § . . . Nothing
ATMOSphere-specific lands in the canonical root (REM-).
Proposed number: § . . (both § . . and

§ . . verified FREE - - ;
 § . . is P _PLAN-reserved – conductor reconciles
 at § . . fetch-first time).

Canonical Constitution.md section (paste-ready)

§ . . – Conflict-free multi-track
 work-division + exactly-once claim registry +
 capability-aware deadlock-proof device-lock
 (User mandate, - -)

Forensic anchor – verbatim user mandate (- - ,
 REM-): "MUST prevent multiple Tracks working the same
 workable item OR the same group of workable items resembling
 one consistent logical group of functionalities. Division of
 work assigned to Tracks MUST be conflict-free: no conflicts,
 misunderstandings, race conditions, data corruptions,
 codebase loss. Risk-free + safe; results ALWAYS produced; no
 false results, no bluff. EXTEND the constitution submodule
 with all these critical details for full universal
 reusability by all projects." (REM-): "there MUST exist
 proper synchronization mechanism for flashing and use of
 device ... lock ... release ... available test devices pool
 and information about held locks ... dead-lock-proof ... a
 track locks one OR more devices selected by required
 capability."

When a project runs multiple concurrent work-STREAM tracks
 (§ . . feature work-stream lifecycle;
 § . . /§ . . parallel streams) that share
 (a) a common pool of workable items and (b) a scarce pool of

exclusive hardware/resources, TWO cooperating arbitration layers are MANDATORY. Both are conflict-free BY CONSTRUCTION, not by convention.

(A) **Work-item layer – exactly-once claim registry (REM-)**.

Every workable item, OR every logical GROUP of items that share files / subsystem / feature / schema (a hidden-coupling cohort), is assigned to AT MOST ONE track at a time. ()

Exactly-once – a lock-arbitrated, append-only claim registry (extending \$. . . no-work-loss registry +

\$. . . real-time sync substrate) records

claim(item|group, track, ts, ttl); a track MUST claim-before-touch; a second claim on an already-claimed item is DENIED

(no silent overlap). () **Logical-group cohesion** – items that

share a file-scope / subsystem / feature / schema are one group and are claimed WHOLE by one track (prevents the hidden-coupling race two tracks editing the same seam would

create – \$. . . L disjoint-file-scope is the

enforcement). () **Conflict-free by construction** – disjoint

file-scope partition (\$. . . L) + per-track

worktree/CoW isolation (\$. . .) means two tracks

physically cannot touch the same bytes. () **No codebase loss**

– \$. . . hardlinked backups, \$. . . ff-only

merge-onto-latest-main (NEVER force-push), \$. . .

working-tree quiescence, \$. . . merge-first. ()

Anti-bluff – the assignment + the merge are verifiable

(registry event stream + captured merge evidence); results

are ALWAYS produced (a claimed-but-abandoned item's claim

TTL-expires and returns to the pool, \$. . .).

(B) **Hardware layer – capability-aware deadlock-proof device-lock (REM-)**. When N tracks outnumber M exclusive test

devices, exactly ONE track owns each device at a time

(\$. . . single-resource-owner). A track leases ONE

OR MORE devices selected by required CAPABILITY (not merely identity) – the pool records per-device capabilities; leases

are capability-matched; multi-device leases are supported.

The arbiter is DEADLOCK-FREE by construction – all four Coffman conditions broken: hold-and-wait ELIMINATED (multi-device acquire is ALL-OR-NOTHING inside one critical section – never a partial hold while waiting); circular-wait ELIMINATED (acquire is NON-BLOCKING – wins the whole set at once or returns EBUSY immediately, never waits on another track's device); no-preemption RELAXED (lease TTL + heartbeat + reap – a crashed holder's lease auto-expires, \$. . , so a dead track never holds the pool hostage); the only lock ever held is a short bounded flock over the atomic check-and-claim critical section, released before any device work. Registry = append-only JSONL event stream + atomically-rewritten snapshot (\$. .).

Reference implementation (this project): scripts/multitrack/multitrack_device_lock.sh + its anti-bluff stress/chaos/paired-mutation proof scripts/multitrack/test_multitrack_device_lock.sh (/ PASS, deterministic × , mutation CAUGHT: guard-removed arbiter double-leases /round vs /round for the real arbiter).

(C) Universal decoupling + evidence-based resource-tuning (REM-). Both layers are universal, decoupled, project-not-aware, reusable (\$. . /\$. . / \$. . .) – the consuming project injects its claim-store, device pool, and metric sources at runtime; nothing project-specific lands in the canonical root. Resource-tuning decisions (parallel-stream count, per-stream memory budget \$. , device-lease breadth, build-queue depth \$. .) MUST be EVIDENCE-BASED – driven by captured metrics (\$. . build-resource stats / \$. . captured evidence), never guessed (\$. .). "Run more tracks / bigger -j " without captured headroom evidence is a \$. . + \$. . violation.

Distinct-but-composing: (A) arbitrates WORKABLE-ITEM/task assignment; (B) arbitrates HARDWARE; they are the two multi-track safety layers and compose (an alias/account resource dimension, REM-^{11 4 28}, is a third that reuses the same registry pattern).

Composes $\$$ ^{11 4 147} . $\$$ ^{11 4 167} / $\$$. . / $\$$. . /

§ . . conductor landing checklist (do NOT skip a step)

- **Fetch-first** – inside `constitution/` : `git fetch --all --prune` every remote; `git pull --ff-only` . Re-confirm
§ . . is STILL free (P _PLAN's § . . or another anchor may have landed); if taken, bump to the next free integer and update every occurrence in this draft + the mirror line before pasting.
- **Paste** the § . . section into `constitution/Constitution.md` after the current last anchor; append the compact mirror line to the anchor-list section of
`constitution/CLAUDE.md` , `constitution/AGENTS.md` , `constitution/QWEN.md` , `constitution/GEMINI.md` (carriers,

3
\$. . /\$. .). Add the full text to
constitution/CLAUDE_ANCHORS_FULL.md if that expansion file is
in use.

- . **Bump** each carrier's revision-header `Revision:` + `Last modified:` (`$ . .`); regenerate HTML/PDF/DOCX exports (`$ . . /$ . .` pipeline).
- . **Wire** the propagation gate `CM-COVENANT-114-176-PROPAGATION` + the recommended gates + their paired `$ .` mutations (gate-code = a separate tracked work item; may land in a follow-up commit).
- . **Validate** – no conflict markers; `meta_test_inheritance.sh` (or equivalent); re-run pre-build.
- . **Commit + push to ALL upstreams** (`$ .`) ff-only (`$ . .` – NEVER force-push); bump the consuming project's submodule pointer in the same commit (`$ . .` step).
- . **Delete this draft** once landed (its content now lives in the live carriers).
