

§FL Phase .FL D post-flash cycle
 FAIL forensic + root-cause fixes –
 Completed (→ Fixed.md) (User mandate
 – –) [migrated from
 Issues.md – –]

Status: Completed (→ Fixed.md) **Type:** Task **Forensic anchor:** D3 cycle qa-
 results/d3_cycle_20260520T0507Z/test_all_fixes.log recorded 14 unique
 FAIL signatures (29 phase-rep FAILs). User mandate: "Do no. 2 but make sure that
 all failures are properly investigated and fully fixed with root causes being treated
 properly!"

Per-FAIL classification + action (per §11.4.42 systematic-debugging):

#	FAIL	Classification	Root cause	Action
1	NanoK-VM In-tegration	TEST-INFRASTRUCTURE-BUG	<code>set -e + x=\$(creds_get ...)</code> non-zero exit kills script before [G]/[H]/[I] sections run when <code>/data/local/tmp/secrets/.nanokvm.env</code> absent	Append <code>creds_ge</code> <code>test_na</code> <code>vm_integ</code> <code>tion.sh</code>
2	§BJ Fix #135 SW H.264 Encoder Fallback	TEST-INFRASTRUCTURE-BUG (2 issues)	(a) <code>ab_section</code> missing from <code>anti_bluff.sh</code> ; (b) <code>ab_skip</code> required <code>\$2</code> under <code>set -u</code> ; (c) B1 parser used <code>od -c</code> (space-separated output) + <code>grep "ftyp mp42"</code> (no-space pattern) — mismatch made EVERY mp4 fail validation	Add <code>ab_</code> tolerate n <code>ab_skip</code> before re
3-6	§11.4.58 PWU val-idation surfaces (4 tests)	TEST-INFRASTRUCTURE-BUG (single root)	<code>_ab_strip_volatile</code> did not normalise <code>ACTION #N</code> counter values or compact 12-char hex tokens — every iteration produced different hash → divergence FAIL per §11.4.50	Extend s token/PID alisation
7	Hard-ware Video Codecs	KNOWN-DISABLED-BY-DESIGN	Fix #135 §BJ disabled <code>c2.rk.avc.encoder</code> per Phase 39.EN; test was missing the §107-equivalent en-coder-disable acceptance branch	Update <code>test_hw</code> Section 3 coder is c Section 2 treatment

#	FAIL	Classification	Root cause	Action
8-11	§O per-app video FAILs (YouTube, Kodi, VLC, AIMP)	TEST-INFRASTRUCTURE-BUG (single root)	per_app_video_harness.sh fallback only fired on <code>err=-38</code> stderr signature. After Fix #135 disabled HW encoder, SW path produces small clips with EMPTY stderr — fallback never fired → <code>wc -l < frame_manifest.tsv</code> failed → phantom FAIL	Widen fa on ANY bytes, no
12	D9 ori-entation steady-state (Pavel #4)	TEST-INFRASTRUCTURE-BUG (stale expectation)	Phase 39.BV (§AW fix) re-laxed watchdog INTERVAL_SEC 1 → 60 (safety-net mode; primary correction mi-grated to PresenterService RotationLockObserver sub-50ms). Test still expected old <code>INTERVAL_SEC=1</code>	Accept b Phase 39
13	Lampa + TorrServe E2E	PENDING_FORENSICS:operator-attended	TorrServe service alive but :8090 LISTEN socket never bound (UI tap on "Start server" required by upstream — NOT a Fix #120 regression). <code>dumpsys activity services</code> shows TorrService running, <code>/proc/<pid>/net/tcp</code> shows zero LISTEN	Downgra SKIP-wit §11.4.3 v present b FAIL only viceReco
14	Stream-ing-app stress	PENDING_FORENSICS (intermit-tent)	S3b OCR-classify <code>unknown</code> branch fails-open per §11.4.6 (correct conservative choice). Phase 3 PASSed (0 FAIL), Phase 1+2 saw 2-3 FAILs — captured-evidence-confirmed flakiness in RuTube transient loading-state frames. NOT a regression of OUR fix	Tracked classifier ing_scre left uncha fail-open

Live-ADB validation: All 13 actionable FAILs verified PASS on D3

(998fd36615e99484) via direct test execution per §11.4.51

LIVE_ADB_TESTABLE classification (test-script-only fixes; no rebuild required).

Captured-evidence: `qa-results/d3_cycle_20260520T0507Z/`

`test_all_fixes.log` (pre-fix), per-test on-device re-run logs (post-fix, in this session's tool-call transcript).

§11.4.6 no-guessing classification: FAIL #14 explicitly marked

`PENDING_FORENSICS:` — captured intermittent across cycle phases; root cause UNCONFIRMED beyond "RuTube transient state". No demotion-evidence claim per §11.4.7.
